Problem Definition

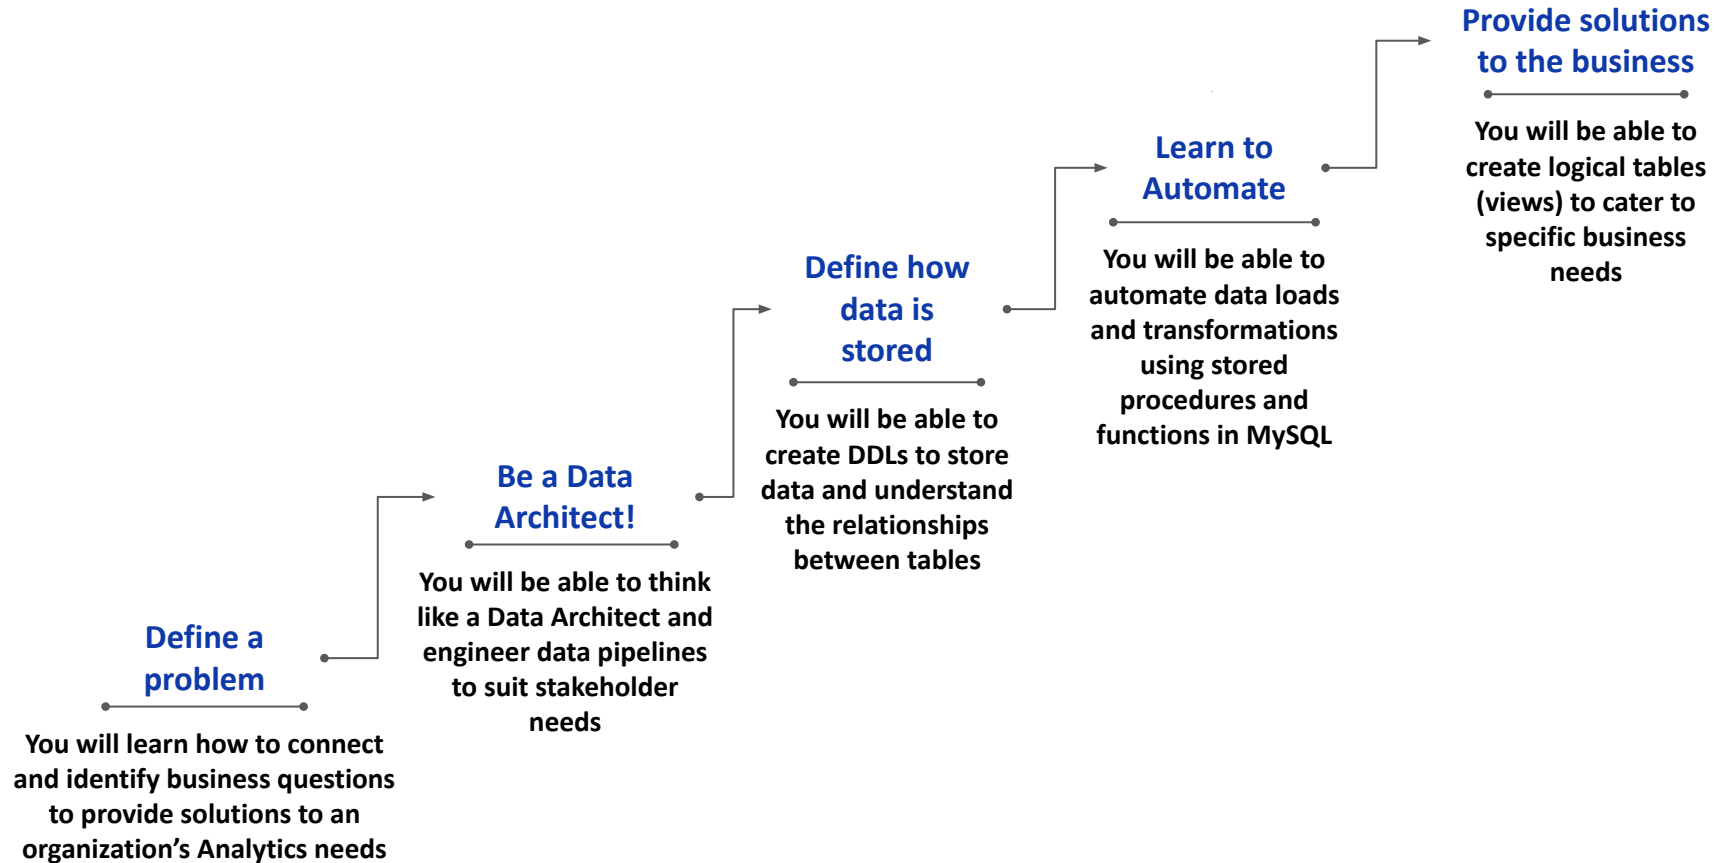

Business Context:

GL-Eats is a food delivery app that delivers orders in ~100 cities across multiple countries. Over the last few weeks, their revenue has dipped, and multiple Teams in GL-eats like Marketing, Delivery Operations, and Revenue Management are rushing to find answers to a lot of questions to solve this problem.

Our Objective:

As part of the centralized **Data and Analytics Team**, our goal is to **Architect a data pipeline in MySQL** to cater to all the questions asked by the various teams, by creating and maintaining a database through which we can ingest our data generated every week and finally create usable tables which can be readily queried by the business stakeholders to find answers to their questions.

Learning Journey and Outcomes

Here are the business questions asked...

How many Orders do we get each week? What is the trend across weeks?	Which Cities are our Vendor Restaurants located? What is the distribution?	Are there specific cities that have a high rate of cancellation?	Which are my high revenue generating restaurants?
Are our Delivery Rating decreasing across weeks?	What is the percentage of customers not satisfied with the service?	What is the average number of Orders an Employee delivers?	Are we giving higher Discounts for higher Order Costs?
What is the average Order Cost each week? Is it trending upwards or downwards?	How many Employees are overworked and delivering above the acceptable limit?	What the distribution of Customers by Order Frequency across?	Do high orders come only from highly rated restaurants?
What is the distribution of Restaurants across Cuisines?	Do Customers who get a higher Discount tend to give a higher Delivery Rating?	Do Customers who give a low Delivery Rating in the previous week, tend to order lesser next week?	What the average number of visits to a restaurant by an employee?
How has employee performance been by week?	What is the average rating of a customer?	How many Customers have used our services so far, across Countries?	What is the average Order Quantity each week? Is it trending upwards or downwards?
What is the WoW% of Revenue?	What is the distribution of employees in a locality?	What is the cancellation rate of a customer?	What is the cancellation rate by employee?
Is there a correlation between restaurant ratings and delivery ratings?	Who are the high and low performing employees?		

Questions related to Restaurants

How many Orders do we get each week? What is the trend across weeks?

Are our Delivery Rating decreasing across weeks?

What is the average Order Cost each week? Is it trending upwards or downwards?

What is the distribution of Restaurants across Cuisines?

How has employee performance been by week?

What is the WoW% of Revenue?

Is there a correlation between restaurant ratings and delivery ratings?

Which Cities are our Vendor Restaurants located? What is the distribution?

What is the percentage of customers not satisfied with the service?

How many Employees are overworked and delivering above the acceptable limit?

Do Customers who get a higher Discount tend to give a higher Delivery Rating?

What is the average rating of a customer?

What is the distribution of employees in a locality?

What is the cancellation rate of a customer?

Who are the high and low performing employees?

Are there specific cities that have a high rate of cancellation?

What is the average number of Orders an Employee delivers?

What the distribution of Customers by Order Frequency across?
